JS Hero

Answer. Here the problem is the following: `{ name: 'amy' } !== { name: 'amy' }`. When comparing two object with equality or strict equality, JavaScript gonna compare the related internal references. Here, these two objects have the same properties and the same value. But in memory, this is 2 different objects. A

solution here could be:

Typical JavaScript interview exercises (explained) - DEV

JavaScript variables can hold numbers like 100 and text values like "John Doe". In programming, text values are called text strings. JavaScript can handle many types of data, but for now, just think of numbers and strings. Strings are written inside double or single quotes. Numbers are written without quotes.

JavaScript Variables - W3Schools

These exercises are based on the variables exercises, so you may start from those (your solutions or ours) or start from scratch.. The Fortune Teller. Why pay a fortune teller when you can just program your fortune yourself? Write a function named tellFortune that: . takes 4 arguments: number of children, partner's name, geographic location, job title.

JavaScript 1: Functions Exercise

Open the HTML and JavaScript files in this folder: exercises_extra\ch06\carousel\ Then, run the application and notice that an enlarged image of the first book in the carousel is displayed. Code an event handler for the click event of the elements in the list. This event handler should start by getting the URL for the image to be displayed.
